the main adenovirus 2 entry).

large amounts of small rnas are produced from the vai and vaii genes late in development for unknown reasons. [5] and [6] demonstrate that vai gene activity influences vaii expression; that the 5' flank affects the start site of the rna but that an intragenic promoter (bases 10626 to 10690 below) determines whether the rna is actually produced; and that there is striking similarity between this rna and trna.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sites; cds start for Ela proteins sites; splice sites in Ela 135 mRNAS sites; splice sites and termini for Elb mRNAS Notes on the presentation of ADENO in the EMBL data library: The genetic map of Adeno is customarily presented from left to right, the 0% position being left and the 100% position being right. The two strands of Adeno are normally represented like this: r-strand:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide maps region 1A of J. Ablating tumor cells in a subject having at least one tumor site contacting the tumor cells in at least one tumor with a lytic age vivo and applying a sufficient in vivo stimulus to the treated tu forming a stimulated tumor.

in

The present invention relates to the compositions and methods for ablating tumour cells in a subject having one or more tumour sites. The method includes introduction of a lytic agent into a tumour (which forms a treated tumour) and application of stimulus to the treated tumour. The stimulus (physical, chemical or biological) induces the level of combination of the lytic agent and tumour cells. The stimulus (physical, chemical or biological) induces the level of combination of the lytic agent and tumour cell stimulus leads to tumour shrinkage. The invention relates to the synchronisation between oncolysis and elevated expression of a heat shock protein (HSP), which results in complete or expected the synchronisation between oncolysis of the system in order to elicit an immune response against the cancer. The method of the invention is useful in ablating tumour cells for treating method of the invention is useful in ablating tumour cells for treating maspharyngeal carcinoma, chondrossarcoma, colon cancer, breast cancer, captured oncogene are good candidates for this method of therapy. The concolytic viruses of this invention comprise generically modified Ads cartivated oncogene are good candidates for this method of therapy. The cancer which consist of a defective p53 tumour suppressor gene or an activated oncogene are good candidates for this method of therapy. The concolytic viruses of this invention comprise generically modified Ads variant Ads (899-001) has an extra stop codon at position 2025 (ED) region) and possesses deletions in ED region (in between 27865 and position 30, 95) spe Genetically modified variant passes of the p53 gene and initiates viral replication. The S98-001 variant is not able to the manune system metasic recognition and elimination of E3 is related to which the p53 protein is dysfunctioned. The function of E3 is related to the ability of an adenovirus to escape from the surveillance of the pin genetically modified variant p45. It has deletions in the immune system metasic recognition Query Match Best Local Similarity Example 61 ۲. ARCESULT 2
ARCESOD 2
ARCES Recombinant vector which is replication-competent in a neoplastic cell and overexpresses an adenovirus death protein, useful in cancer therapy when used together with replication-defective adenovirus which expresses an anti-cancer gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               X88888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a recombinant vector (VI) which is replication-
competent in a neoplastic cell and which overexpresses an adenovirus
death protein (ADP). The vector can be used in a method for promoting
death of a neoplastic cell that comprises contacting the neoplastic cell
with at least one VI; and a composition comprising VI and a second
recombination virus which is: (a) replication defective and which
composition anti-cancer gene product, where VI complements replication
complastic cell: VI, together with one or more replication-defective
adenovirus which expresses an anti-cancer gene product, are useful in
complastic cell: VI, together with one or more replication-defective
adenovirus which expresses an anti-cancer gene product, are useful in
complastic cell: VI, together with one or more replication-defective
adenovirus which expresses an anti-cancer gene product, are useful in
complastic cell: VI, together with one or more replication defective
adenovirus which expresses an anti-cancer gene product, are useful in
complete therapy. Overexpression of ADP by VI results in faster lysis of
complete mucleotide sequence of ADP. The present sequence represents the
complete mucleotide sequence of an adenovirus subgroup C anti-cancer
vector GZI containing E3 deletion and overexpressing ADP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5
                                                                                               The invention relates to a recombinant vector (VI) which is replication-competent in a neoplastic cell and which overexpresses an adenovirus death protein (ADP). The vector can be used in a method for promoting death protein (ADP). The vector can be used in a method for promoting death of a neoplastic cell that comprises contacting the neoplastic cell with at least one VI; and a composition comprising VI and a second recombination virus which is: (a) replication defective and which cexpresses an anti-cancer gene product, where VI complements replication of the second recombinant virus; or (b) replication-competent in a composition comprise virus of the second recombinant virus; or (b) replication-competent in a complastic cell. VI, together with one or more replication-defective adenovirus which expresses an anti-cancer gene product, are useful in cancer therapy. Overexpression of ADP VI results in faster lysis of cells and spread of the versus throughout a cell monolayer than viruses expressing wild-type levels of ADP. The present sequence represents the complete nucleotide sequence of an adenovirus subgroup C anti-cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant vector which is replication-competent in a neoplastic cell and overexpresses an adenovirus death protein, useful in cancer therapy when used together with replication-defective adenovirus which expresses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 5; Page 147-156; 196pp; English

Novel modified adenovirus protein IX and its presence in virus or virus-like particle, useful for improving gene delivery efficiency in target cell of virus or virus-like particle.

Disclosure; Fig 6; 126pp; English.

The invention relates to a novel adenovirus protein IX (pIX) modified by mutation of one or more amino acids of pIX as compared to corresponding wild-type pIX and/or to comprise a binding moiety. The presence of modified pIX in a virus or virus-like particle (VLP) results in improved gene delivery efficiency in the target cell of a virus or VLP as compared to the gene delivery efficiency of a virus or VLP containing wild-type pIX. The protein of the invention has haemostatic, cytostatic, anti-HIV, and virucide activity. The sequence may have a use in gene therapy. The present sequence represents the human adenovirus type 5 genome

```
The invention relates to a recombinant vector (VI) which is replication-
competent in a neoplastic cell and which overexpresses an adenovirus
death protein (ADP). The vector can be used in an enthod for promoting
death of a neoplastic cell that comprises contacting the neoplastic cell
with at least one VI; and a composition comprising VI and a second
recombination virus which is: (a) replication defective and which
cx expresses an anti-cancer gene product, where VI complements replication
confit the second recombinant virus; or (b) replication-competent in a
neoplastic cell VI, together with one or more replication-defective
adenovirus which expresses an anti-cancer gene product, are useful in
cancer therapy. Overexpression of ADP by VI results in faster lysis of
cells and spread of the virus throughout a cell monolayer than viruses
expressing wild-type levels of ADP. The present sequence represents the
complete nucleotide sequence of the genome of human adenovirus Ad5,
c useful for cancer gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The method is useful for generating vectors, especially mAd vectors. The method is useful for transferring nucleotide sequences of interest into a cell, for gene cC transfer applications (e.g. gene therapy) in vitro, ex vivo and in vivo. CC The nucleotide sequences are useful for treating diseases associated with cc it, i.e. adenosine deaminase gene associated with adenosine deaminase cd deficiency with severe combined inmune deficiency, beta-chain of CC disease, receptor for low density lipoprotein gene associated with CC disease, receptor for low density lipoprotein gene associated with gene associated with penylalanine hydroxylase (PAH) gene associated with penylalanine hydroxylase (PAH) gene associated with phenylketonuria, CC dystrophin gene associated with muscular dystrophy, and human cystic fibrosis. The present nucleic acid sequence represents a human adenovirus genome sequence that was used in the methods of the invention

IID ARBS8883 The present invention relates to a new method of producing a vector. The combined involves introducing recombinant vector having nucleotide sequence (NS) having 5' and 3' end, left and right inverted terminal repeats of compositions are present and adenovirus packaging sequence linked to inverted terminal repeat packaging sequence linked to inverted compositions of the composition of the co

The invention relates to a nucleic acid encoding a Mét-NS3-NS4A-NS4B-NS5A CC -NS5B (NS stands for non-structural protein from HCV) polypeptide cappearing as ABU09574. The encoded polypeptide has sufficient protease CC activity to process itself to produce an NS5B protein that is enzymatically inactive. Also included are a cultured recombinant cell CC comprising the novel nucleic acid, making an adenovector (comprising: (a) producing an adenovirus genome plasmid comprising a gene expression cC cassette by homologous recombination between the novel nucleic acid and a nucleic acid comprising a first adenovirus region from base pair 1-450 cc corresponding to either Ad5 or Ad6, a second adenovirus region from base pair 3518-5548 corresponding to Ad5 or from base pair 3508-5541 cc corresponding to Ad6, joined to the first region, a third adenovirus region from base pair 3542-28133 corresponding to Ad5 or from base pair 5549-28133 corresponding to Ad5 or from base pair court for adenovirus region from base pair 30789-33784 corresponding to Ad6, joined to the second region, a fourth adenovirus region from base pair 30789-33784 corresponding to Ad6, joined to the third region, and a fifth adenovirus region from base pair 3386-33956 corresponding to Ad5 or from base pair 30789-33784 corresponding to Ad6, joined to the third region, and a fifth adenovirus region from base pair 3385-35759 corresponding to Ad6, joined to the courth region; and (b) rescuing the recombinant adenovirus from the crecombinant adenovirus plasmid), an adenovirus from the crecombinant plasmid), an adenovirus from the first produced by the plasmid and plasmid plasm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid encoding a Met-NS3-NS4A-NS4B-NS5A-NS5B polypeptide, useful as a component of an adenovector or DNA plasmid vaccine for preventing or treating hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             11-OCT-2001; 2001US-0328655P.

                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                             문
                                                                                                                               á
                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a nucleic acid encoding a Met-NS3-NS4A-NS4B-NS5A CC -NS5B (NS stands for non-structural protein from HCV) polypeptide CC appearing as ABU09574. The encoded polypeptide has sufficient protease CC activity to process itself to produce an NS5B protein that is CC enzymatically inactive. Also included are a cultured recombinant cell CC comprising the novel nucleic acid, making an adenovector (comprising comprising a first adenovirus region from base pair 1-450 CC producing an adenovirus genome plasmid comprising a gene expression and cassette by homologous recombination between the novel nucleic acid and a cassette by homologous recombination between the novel nucleic acid and a cassette by homologous recombination between the novel nucleic acid and a cassette by homologous recombination between the novel nucleic acid and a cassette by homologous recombination between the novel nucleic acid and a cassette by homologous recombination between the novel nucleic acid and a cassette by homologous recombination between the novel nucleic acid and a cassette by homologous recombination between the novel nucleic acid and a corresponding to Ad5 or from base pair 3511-5548 corresponding to Ad5 or from base pair 3511-5548 corresponding to Ad5 or from base pair 5549-2813 corresponding to Ad5 or from base pair 3784 corresponding to Ad6, joined to the second region, a fourth region, and (b) rescuing the recombinant adenovirus from the crecombinant adenovirus plasmid), an adenovirus algorities from the crecombinant adenovirus plasmid), an adenovirus vector that is produced by method above appearing as ACA61113 which has a humanised version of the polyprotein, a recombinant nucleic acid comprising one or more Ad6 coplyprotein, a recombinant nucleic acid comprising one or more Ad6 region is useful as a component of an adenoviral vector or a DNA plasmid vaccine providing ab broad range of antigens for generating an HCV-specific cell cell mediated immune response. The nucleic acid may also be used in treating p
                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                  The invention relates to a new viral DNA construct encoding for an adenovirus capable of replication in a human or animal tumour cell; that comprises one or more transcription factor (TF) binding sites operatively positioned together with the BIA open reading frame to promote expression of EIA proteins in the presence of the TF. The viral construct and/or virus is useful in the manufacture of a medicament in the therapy of patients having neoplasm, where they are capable of causing death to tumour cell; They are useful in treating malignant and metastatic tumours derived from colon cells particularly liver tumours also for treating colorectal cancers and melanomas. The present sequence represents the DNA sequence of human adenovirus type 5
